

Understanding polymeric nanoparticle accumulation in tumours using dynamic microfluidic systems

Amber Prior

PhD Student
Thurecht Group

- Improved efficacy
- Bioavailability
- Targeting efficiency

Biological Barriers that Nanoparticles Encounter

1

Endothelial Barrier

2

Extracellular Matrix (ECM)

3

Plasma membrane and intracellular localisation

2D Cell Culture:

Bridging

Animal models:

cell coculture

3D cell culture

Bioprinted
cell/tissue culture

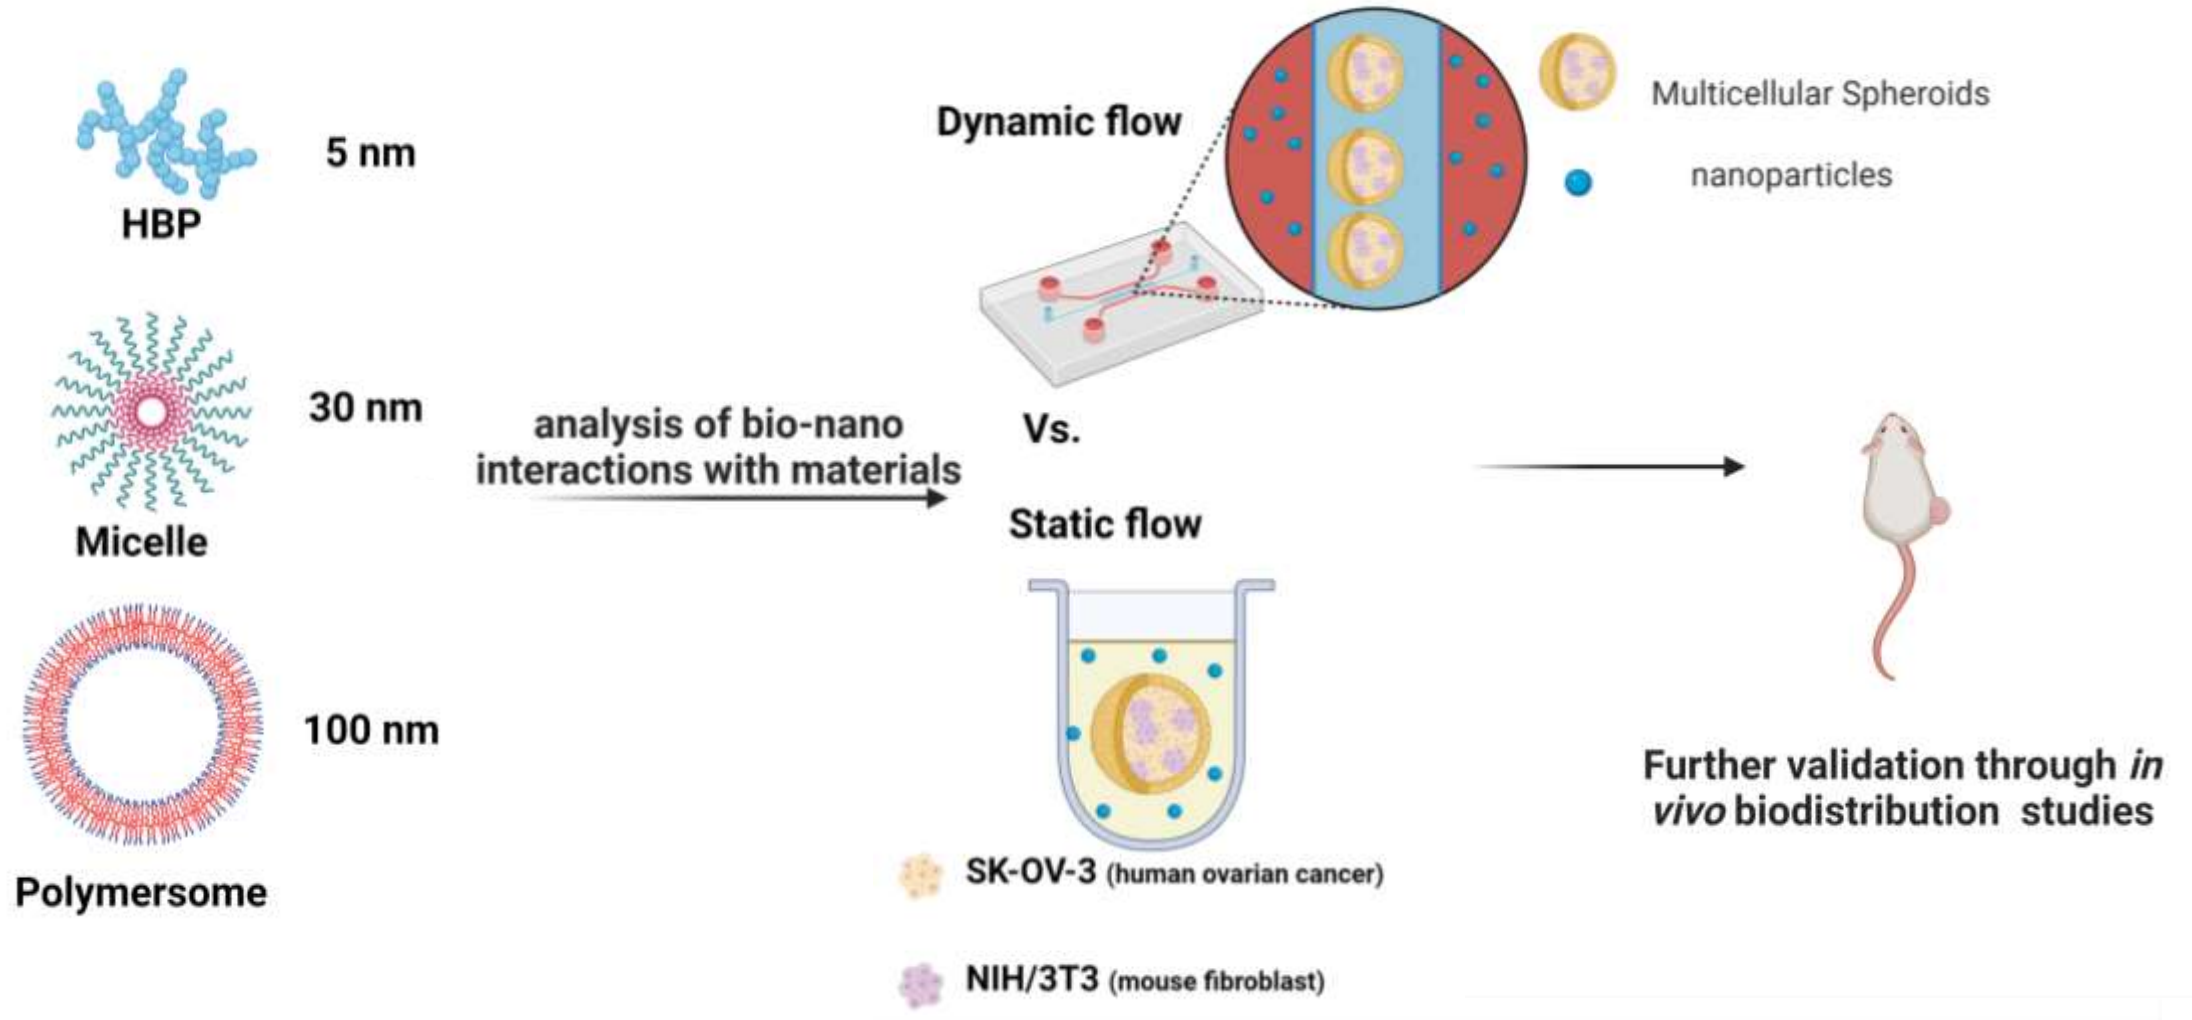

Microfluidics and
flow assays

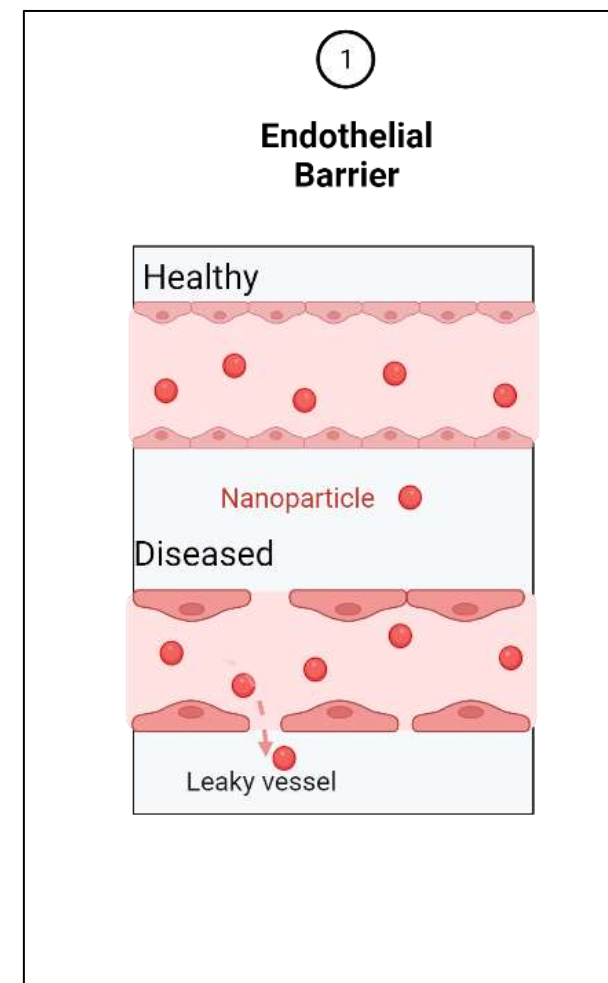

- Inexpensive, high-throughput screening capabilities
- Recapitulate biologic transport as well as microenvironments
- Enables studies of cell behaviour in real time

- Can incorporate healthy and diseased cells
- Creates nutrient gradients typical of vascularised tissue
- Nanoparticle uptake and penetration can be visualised

Microfluidic Device Fabrication Process

Step 1: Mask Design

Design using
L-edit software

Step 2: Mask Writing

5" Chrome Mask

Heidelberg
uPG101 Laser
writer

Development
and cleaning
of mask

Step 3: Photolithography (Dry Film Lamination)

Laminator

EVG Mask
Aligner

Development
and cleaning
of wafer

Step 4: Soft Lithography (PDMS Casting and Curing)

Add PDMS and curing
agent to wafer in a petri
dish

Let cure at 80°C for 30
minutes

Cut out individual devices
and punch holes for inlet
and outlets

Plasma clean and bond
device to glass slide

NP accumulation in static spheroids over time

NP accumulation in microfluidic device over time

Static flow

NP SKOV-3 cell association on tumour-on-a-chip

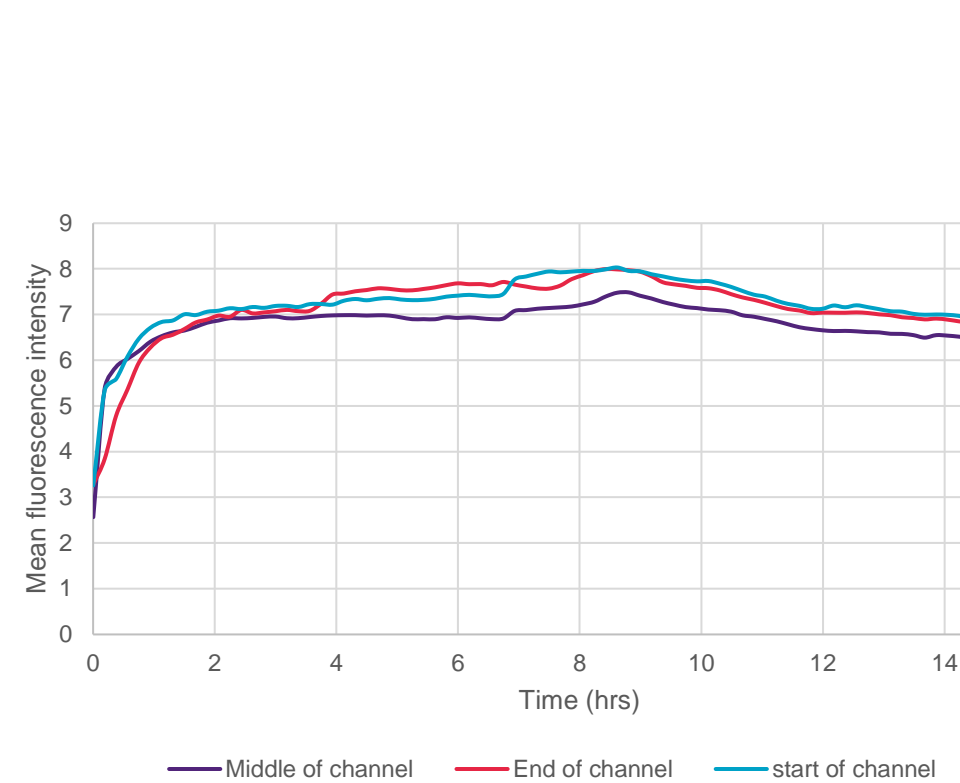

Normalised SKOV-3 cellular association

- Large variation in on-chip studies
 - Spheroid's position
 - Inconsistent perfusion of materials

Discrepancies in perfusion

Nanoparticle accumulation in macrophages

0 hr

Summary and future directions:

Large translational gap exists between cellular and animal studies

Can bridge this gap by creating a more complex *in vitro* system

2D Cell Culture:

Purpose:

fundamental cell-nanomaterial interactions

Animal models:

Purpose:

fundamental bio-nanomaterial interactions

Clinic:

Translational Gap

Translational Gap

Bridging

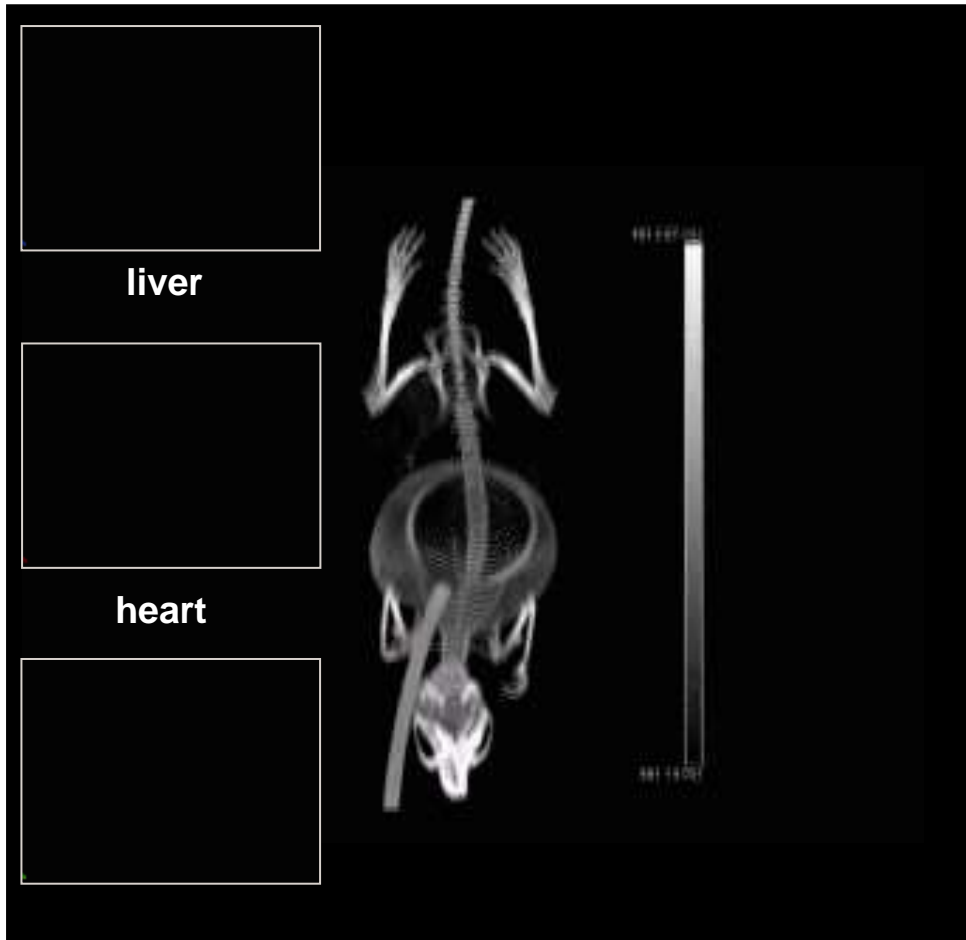

cell coculture

3D cell culture

Bioprinted cell/tissue culture

Microfluidics and flow assays

Summary and future directions:

Match polymer concentration with *in vivo* blood circulation

Investigate *in vivo* tumour accumulation and penetration of NPs
